B, C, D, E, F, and G, draw the meridian distances, Ba, Cb, Dc, Ee, Fd, and Gf, perpendicular to this meridian, and also B, Cw, DA, and C, parallel to it; aB will be the first multiplier. Now the area of the figure, JCDEFGJ is equal to the figure JCB AGH—the required area of the tract. And the difference of latitude and departure of the several sides will be found as in the following table. Thus Aa is the northing of AB, and aB is its easting; ab is the northing of BC, and C its easting, and so on. Also, according to the rule, aB(-C or bC, is the E. D. D. of BC, as they are of the same kind, and fG--aB is the W. D. D. of aB. Having obtained the double departures for the several sides, assume the multiplier aB, and find, by the rule, the several other multipliers aB and c, observing carefully, whether these multipliers are east or west. And place the areas of the product of the multipliers into their collateral northings or southings, in the columns of north or south areas, according to the proper relations between these multipliers and latitudes as given in the rule. These areas are double the required areas—being each of them double the areas of the several trapezoids into which the figure has been divided. Half the difference, therefore, of the north and south areas will be the required area. Now dm...
